Rs 54,000 cr lost in digital arrests, this is dacoity: SC

Ananthakrishnan G
New Delhi, February 9

THE SUPREME Court on Monday questioned the role of the Reserve Bank of India (RBI) and other banks in checking instances of digital arrests and asked them to put in place Artificial Intelligence (AI) tools that will flag suspicious transactions.

Chief Justice of India Surya Kant presiding over a three-judge bench said reports indicate that over Rs 54,000 crore has been lost in digital arrests and wondered why action is yet not forthcoming.

"If RBI does not take any stern, coercive decision even at this stage when the information in public domain, official or unofficial, suggests that definitely more than Rs 25,000 crore has been siphoned off…One of the figures sent to me talks of 54,000-plus crore of hardened money of the victims taken away," the court said, adding that it is absolute "robbery, dacoity".

CJI Kant also criticised the indiscriminate lending by banks saying "what is happening is that these banks are in due course of time becoming a huge

WHAT THE TOP COURT SAID

"In their overemphasis to make profit, they (banks) must understand that they are trustees of this money. The people deposit because they have trust in them…"

When a digital arrest victim transfers sums that are unnaturally high, even that can be detected using AI tools and can be paused… That has not been done"

These banks are in due course of time becoming a huge liability on the public at large. The courts have become their recovery agents. They grant reckless loan amounts and then you have NCLT and various other quasi-judicial systems only to recover money for them…"

they are indulging in this …"

Attorney General R Venkataramani, meanwhile, informed the court that the RBI has come up with an SOP for banks to deal with digital arrest cases. Taking note, the court directed the Union Ministry of Home Affairs to formally adopt and implement the SOP dated January 2, 2026 across India for inter-agency coordination, location of

authorities to "jointly hold a meeting to evolve a framework for victim compensation in digital arrests cases".

Posting the matter for hearing after two weeks, the court also sought a fresh status report.

Amicus Curiae Senior Advocate N S Nappinai told the bench, which also comprised Justices Joymalya Bagchi and N V Anjaria, that the "RBI is only

banks. "But RBI's own circular mandates that banks have to develop AI tools which go beyond Mule Hunters, which will include velocity checks. When a digital arrest victim transfers sums that are unnaturally high, even that can be detected using AI tools and can be paused or it can be a trigger which will then ensure either pausing of the transactions at the issuer bank itself or at the receiving bank's end. That has not been done."

The CJI said, "There will be certain grey areas where probably with a view to whatever may be, we will not say it's their compulsion, but they may not want to pressurise banks to adopt certain things. But it does not mean that we will also finally agree to that. We will then see what is to be done by us."

Reiterating that banks should be able to detect with AI when unusual transactions take place in accounts which see nominal activity every month, the CJI said, "We hope that they will not invite a direction (from us)… If RBI can introduce some…robust mechanism."

Justice Bagchi said, "The problem is banks are more into

Cyber frauds threaten India's digital economy: bridging institutional gaps and policing

RAJEEV KUMAR

Rising cyber frauds threaten India's digital economy. Highlighting banking silence, ineffective policing, and systemic weaknesses, this article outlines actionable reforms to protect citizens, strengthen institutions, and restore public trust.

Digital Growth and Rising Threats

India's digital revolution — driven by smartphones, affordable internet, online banking, and e-commerce — has transformed daily life, delivering speed and convenience at an unprecedented scale. Yet, this success has also opened the door to an alarming rise in cybercrimes. Fraudsters exploit technological loopholes, deceiving citizens through false promises, fake arrests, or fear-driven tactics.

The numbers highlight the crisis: thousands of cyber fraud cases are reported daily, but the figures are far higher. Many victims remain silent due to stigma, fear of harassment, or a lack of faith in the system. Those who approach the authorities are often trapped in endless procedures, bureaucratic hurdles, under-equipped cyber police, and banks that deflect responsibility onto customers.

Banks, as custodians of public money, are mandated to ensure the safe custody of financial assets and personal data. Yet they frequently mishandle sensitive information, enabling fraudsters to exploit customers. This systemic negligence erodes digital trust—the very foundation of a digital economy. Without urgent reforms in policing, banking, and Governance, India's ambitious Digital India vision risks losing public confidence.

Cyber Frauds

Fraudulent ATM withdrawals were among the most visible forms of cyber-enabled crime. However, fraud has evolved into far more sophisticated and invasive methods. Phishing emails and SMS messages trick users into revealing sensitive data, while remote access scams manipulate victims into installing malicious apps that give fraudsters complete control over their devices.

Other widespread methods include job and loan scams, preying on the aspirations of young and financially vulnerable individuals, and OTP or UPI frauds, where criminals

and abroad, manipulate users into unknowingly authorizing transactions. Equally damaging is identity theft, in which stolen Aadhaar, PAN, or bank details are misused for further fraud.

These evolving techniques demonstrate the increasing sophistication of cybercriminals and underscore the urgent need for stronger institutional safeguards to protect citizens and sustain confidence in India's digital economy.

Digital Arrests: Fear as a Weapon

Among the growing spectrum of cyber frauds, few are as alarming as digital arrests. This new-age scam weaponizes fear and misplaced trust in authority. Fraudsters impersonate police officers, customs officials, or central agency investigators, accusing victims of fabricated crimes and coercing them into paying money to settle charges.

Fraudsters use video calls to display fake badges, digital warrants, or forged official seals. In some cases, victims are kept on continuous calls for hours — isolated, intimidated, and psychologically pressured until they transfer large sums of money. These scams rely not on hacking skills but on exploiting the fear and respect ordinary citizens associate with law enforcement.

Digital arrests are a stark reminder of how easily authority can be imitated in the digital age. Despite media reports and awareness campaigns, such frauds continue unchecked. Many victims remain silent, fearing ridicule or further harassment. The absence of swift institutional responses — from both cyber police and banks — has only emboldened fraudsters, allowing this menace to grow.

Ineffective Cyber Policing: A System Under Strain

Cyber police units were conceived as the frontline defenders of digital citizens, but they remain under-resourced, under-trained, and ill-prepared for the scale of today's cyber threats. Most state-level cyber cells lack advanced forensic tools, AI-driven monitoring, or a sufficient workforce to respond effectively.

Victims often report that filing complaints is itself an ordeal. They encounter procedural hurdles, jurisdictional wrangling, and in many cases outright indifference. The crucial 24 hour golden window, during which fraudulent transactions can be traced and frozen, is seldom utilized effectively. By the time action is taken, the stolen funds are usually unrecoverable.

Adding to the problem, many cybercrime complaints are casually dismissed as civil disputes, discouraging victims from seeking justice. This institutional emboldens cybercriminals, allowing them to act with near impunity. Unless systemic reforms are undertaken—through specialized training, real-time monitoring, and stronger accountability — cyber police will remain largely symbolic, unable to fulfill their mandate of protecting citizens in the digital age.

Banks Silence in Controlling Cyber Frauds

The Reserve Bank of India (RBI) mandates swift resolution of unauthorized transactions, yet most banks routinely shift responsibility onto customers. Victims are frequently accused of negligence for sharing OTPs through suspicious links, even though fraudsters use highly sophisticated tactics that can deceive even the most cautious users. Banks, as custodians of public trust, should be proactive defenders against fraud. Instead, their preventive steps remain superficial: SMS alerts or generic advisories offer little real-time protection. A greater concern is the unchecked growth of mule accounts through which stolen money is laundered. Weak KYC processes and poor audits allow such accounts to thrive, and even when suspicious patterns are identified, banks often delay freezing them, citing procedural hurdles.

The grievance redressal process adds to victims frustration, forcing them into months of struggle with little hope of compensation. This lack of accountability amplifies financial losses and undermines public trust in digital banking. Such institutional inaction seriously threatens the credibility of the entire banking ecosystem.

Towards a Safer Digital Ecosystem

India needs a comprehensive, multi-pronged strategy addressing citizens, law enforcement, banks, and governance to build a safer digital future.

1. Citizens, Society, and Awareness: Nationwide campaigns should expose scams such as digital arrests, while cyber hygiene must become part of school and college curricula.

Community-based vigilance can help flag suspicious activities, and special initiatives must protect digitally illiterate populations, particularly older people, who remain highly vulnerable to cyber fraud.

2. Cyber Police: Specialized cybercrime cadres must be created with training in digital forensics, AI, and blockchain tracing. Dedicated 24/7 rapid response units should act within the critical 24 hour window when fraudulent transactions can still be intercepted. Stronger cross-border cooperation frameworks are essential. Cyber police must develop user-friendly complaint systems — multilingual helplines, one-stop portals, and case status updates — to encourage more victims to come forward.

3. Banks and Financial Institutions: They must abandon their current policy of weak data protection, under which customers information is easily accessible to other banks and fraudsters. Banks should tighten KYC norms and conduct periodic audits to detect mule accounts.

A shared fraud intelligence platform linking banks, telecom operators, and law enforcement would enhance early detection. Above all, banks must guarantee swift compensation in line with RBI guidelines, without shifting blame to customers.

4. For Policy and Governance: A National Cyber Protection Authority (NCPA) should be established with statutory powers to coordinate across sectors. Regular performance audits of both banks and the cyber police must enforce accountability.

Finally, the Information Technology Act, 2000, India's primary law governing digital activities, cybercrimes, and electronic commerce, must be updated to ensure that institutions — not only individuals — can be held accountable for systemic failures in preventing cybercrime.

Restoring Trust in India's Digital Future

The strength of a digital economy rests on trust, yet cyber frauds are steadily eroding this foundation. Today, citizens find themselves trapped in a vulnerable space — where fraudsters exploit loopholes, banks deflect responsibility, and cyber police struggle with inefficiency.

The way forward demands decisive reforms. Cyber police must be strengthened with technology, training, and victim-focused systems. Banks must accept their role as custodians of public trust and adopt proactive protection measures.

Citizens must be aware and resilient, while policymakers must ensure governance frameworks that enforce institutional accountability. The time to act is now — decisive and collective measures are essential not only to shield citizens from financial and psychological harm, but also to preserve India's digital economy credibility, resilience, and future.

SC calls digital fraud dacoity, orders SOP to protect victims

PIONEER NEWS SERVICE
New Delhi

WIKIMEDIA COMMONS

In a bid to crack down on the rising menace of "digital arrests", the Ministry of Home Affairs (MHA) has informed the Supreme Court that it has constituted a high-level inter-departmental committee (IDC) to eliminate systemic gaps and ensure real-time protection for cybercrime victims. The Supreme Court on Monday described the siphoning of huge money by digital frauds as absolute "robbery or dacoity" and asked the Centre to draft a standard operating procedure in consultation with stakeholders like the RBI, banks and the Department of Telecommunications to deal with such cases.

The SC also expressed grave concern over the "menace" of digital arrest scams and said banks must play a proactive role in preventing cyber-enabled fraud. A bench comprising Chief Justice of India Surya Kant and Justices Joymalya Bagchi and NV Anjaria observed that banks have a fiduciary responsibility to alert customers when unusual, large-scale transactions occur in accounts typically used for sending or receiving small amounts. CBI also informed the court of taking over the cases, ranging over. ₹1.64 lakh crores.

The Supreme Court also asked the Reserve Bank of India (RBI), the Department of Telecommunications (DoT), and others to jointly hold a meeting to come up with a framework for providing compensation in digital arrest cases.

How to safeguard India's digital economy

Cyber frauds have moved far beyond the fraudulent ATM withdrawals of earlier years. Today, criminals deploy more sophisticated and targeted strategies

Rajeev Kumar

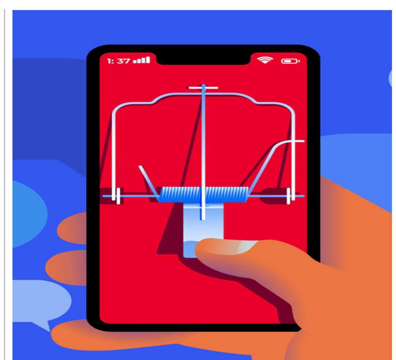
India's digital transformation — powered by affordable Internet, digital banking, and e-commerce — while enhancing convenience and inclusion has also created a fertile ground for cybercrime. Fraudsters exploit system loopholes and human psychology, using tactics such as phishing, OTP/UPI frauds, identity theft, loan scams, and increasingly, digital arrests. These frauds rely less on hacking skills and more on manipulation of fear and trust.

Perils of social engineering

The most vulnerable victims include elderly citizens, rural populations, and weaker groups such as job seekers or loan applicants. Many senior citizens remain digitally illiterate yet hold substantial savings, making them prime targets. Fraudsters often obtain leaked banking or personal data to identify such customers, tailoring scams to exploit their weaknesses. Social engineering is at the core of these crimes — manipulating fear, greed, or urgency. Even educated individuals often surrender under sustained psychological pressure, showing how deeply criminals exploit human behaviour.

Two recent digital arrest cases highlight the role of fear. In the first, a 78-year-old retired banker was duped of ₹23 crore — siphoned through 21 transactions to 16 accounts. In the second, a lawmaker's wife was defrauded of ₹14 lakh but was able to recover it as she acted swiftly. Together, these cases show a stark contrast — delay leads to irreversible losses, while swift action can save victims from ruin. These cases underline the urgent need for systemic reforms such as AI-driven monitoring to flag abnormal transactions; banks mandated to act within the 24-hour window; cyber police equipped to respond swiftly etc. Proactive detection and rapid coordination between banks and law enforcement are essential to prevent such scams from succeeding.

However, institutions have failed to keep pace. Banks, entrusted with safeguarding public money, often limit their role to issuing generic advisories, while mule accounts with weak KYCs



GETTY IMAGES

sophisticated and targeted strategies. Phishing attacks lure users into revealing sensitive data through fake emails or SMS

early warning signals. First is scale. Fraudulent transfers are frequently many times larger than a customer's normal

These patterns are not isolated anomalies but hallmarks of organised cyber fraud. The failure to monitor them proactively reflects systemic negligence, leaving criminals ample room to thrive.

Possible interventions

The current institutional approach is largely reactive — fraud is addressed only after complaints are filed. Artificial Intelligence (AI) and Machine Learning (ML) can shift this model to proactive prevention through the following methods:

Personalised transaction profiles: AI can map each customer's typical transaction size, frequency, timing, and risk category (for example, senior citizens, rural users, high-net-worth individuals). Customers can be grouped into clusters to generate targeted alerts for deviations from normal activity. Unusual patterns — such as abnormally large transfers or frequent debits — can trigger alerts, require confirmation, or temporarily block the transaction until verified. Clustering algorithms and anomaly detection models can flag behaviours such as unusually large one-off transfers, multiple debits within short intervals, or mule accounts receiving sudden inflows. ML systems can also identify accounts with incomplete or fake KYCs, preventing them from becoming conduits for laundering.

Cross-institutional monitoring: Banks operate in isolation without sharing information with the cyber police or telecoms. An AI-enabled fraud intelligence and early detection network could enable real-time sharing of alerts across banks, payment systems, and telecom providers. If one bank identifies a suspicious account, others could be notified instantly, preventing fraudsters from exploiting institutional gaps.

Empowering the cyber police: AI offers real-time detection and automated alerts for law enforcement, allowing swift action within the crucial 24-hour window. With global data-sharing and stronger international cooperation, AI can make cyber policing faster, more agile, and citizen-friendly.

Strengthening accountability of banks: Banks must adopt AI-driven monitoring, plug KYC gaps, and explore Blockchain for secure, tamper-proof customer data management.

Frauds today are not invisible — they are detectable with the right tools. What is missing is not technology, but institutional will. With AI-driven monitoring, fraud detection can evolve from reactive firefighting to proactive prevention.

The way forward

India must shift to a protection-first framework, where citizen safety and
